QA ASSESSMENT TASK · DELIVERABLE 3

Enhancement Recommendations

PlanRadar Form Builder

Prepared by Mohamed El Hadad · 23 Oct 2026 · Based on Test Plan v1.2 and 28 executed test cases (2 cycles)

1 Executive summary

All 28 executed test cases passed across two cycles and no Form Builder defect was found. The recommendations below are product improvements, not bug fixes. The top priority is making permissions **visible before they hurt**: admins today discover what a role can see or edit only by signing in as that role.

8	5	3	0
recommendations	observed during execution	high priority	defects found

2 Recommendations at a glance

ID	Recommendation	Source	Priority	Effort
R1	Preview form as a role	Observed	High	M
R2	Explain effective ticket access	Observed	High	M
R3	Name the missing fields in the mandatory error	Observed	High	S
R4	Inline list assignment recovery	Observed	Medium	S
R5	Roles × fields permission matrix	Analysis	Medium	M
R6	Validation rules for Number, Decimal, Text	Observed	Medium	M
R7	Default value for List fields	Analysis	Low	S
R8	Form change history	Analysis	Low	L

Observed = seen while executing the test cases. **Analysis** = gap identified from the PlanRadar knowledge base and test design. Effort: S = days, M = 1–2 sprints, L = more than 2 sprints (estimate).

3 Impact vs effort

Quick wins (now): R3, R4 – small changes that remove friction seen during testing.

Strategic (next): R1, R2, R5, R6 – larger features that prevent permission and data-quality issues.

Later: R7, R8 – useful additions with lower impact.

4 Detailed recommendations

R1 Preview form as a role

Observed | High

OBSERVED	The same ticket showed Internal Notes as editable for QA_Editor, read-only for QA_Viewer and hidden for QA_Restricted (TC-011, TC-012, TC-013). Confirming this required signing in with three different accounts.
IMPACT	Admins cannot verify a permission set before users hit it; a misconfigured field can expose data or block work.
RECOMMENDATION	Add a **Preview as role** option next to *Preview form* in the Form Builder that renders a read-only ticket as the selected role would see it.
ACCEPTANCE CRITERIA	• Admin can pick any project role or Subcontractor. • Preview matches that role's Visible To / Editable By settings: hidden fields absent, read-only fields locked. • No ticket data is created or changed.

R2 Explain effective ticket access

Observed | High

OBSERVED	QA_Editor first saw zero tickets although the user was assigned to the project, because the role had *View = Tickets created by the user*. Changing it to *All tickets* fixed it (TC-010 precondition).
IMPACT	Field permissions look broken when the real cause is the role's ticket View scope; this costs admin and support time.
RECOMMENDATION	On the role and field permission screens, show an **effective access check** for a chosen role and ticket: project membership, ticket View / Edit scope and field permission, with the one that blocks access highlighted.
ACCEPTANCE CRITERIA	• Result is shown as Accessible or Blocked. • The limiting setting is named and linked. • Nothing is changed automatically.

R3 Name the missing fields in the mandatory error

Observed | High

OBSERVED	Saving with an empty mandatory field shows a red outline and the generic toast "You have not filled in all the required fields" (TC-018). The message does not say which field is missing.
IMPACT	In long forms with collapsed groups, users must scroll to find the outlined field, especially on mobile.
RECOMMENDATION	List the missing field names in the message and move focus to the first one, expanding its group if collapsed.
ACCEPTANCE CRITERIA	• Message names every empty mandatory field. • Clicking a name scrolls to and focuses that field. • Fields hidden from the user's role are never listed.

R4 Inline list assignment recovery

Observed | Medium

OBSERVED	While Inspection Category had no list assigned, *Apply* stayed disabled and the form could not be assigned to the project until a list was selected (TC-002).
IMPACT	The disabled button gives no reason, so admins must guess which field blocks the assignment.
RECOMMENDATION	Name the unassigned List field in a validation message and offer an inline **Select existing list** action next to it.
ACCEPTANCE CRITERIA	• Apply stays disabled while any List field is unassigned. • Each blocking field is identified. • Selecting a valid list clears its error; Apply enables when all are resolved.

R5 Roles × fields permission matrix

Analysis Medium

GAP

Permissions are edited one field at a time (Visible To / Editable By) or copied with *Apply to all fields*; there is no single view of all fields against all roles.

RECOMMENDATION

Add a grid view with fields as rows, roles as columns and a View / Edit / Hidden selector per cell, plus CSV export for audits.

ACCEPTANCE CRITERIA

- Every change in the grid matches the per-field settings.
- Edit cannot be granted without View.
- Subcontractor limits are enforced in the grid.

R6 Validation rules for Number, Decimal and Text fields

Observed Medium

OBSERVED

Estimated Cost (Decimal) saved -1 and 999999999 without any warning (TC-021, OB-01). The Form Builder offers no minimum / maximum for numeric fields and no length rule for text.

RECOMMENDATION

Add optional Min, Max and decimal places for numeric fields and Max length for text fields, with a clear inline message.

ACCEPTANCE CRITERIA

- Out-of-range values block saving with a message naming the limit.
- Rules apply the same on Web and mobile.
- Existing tickets are not changed when a rule is added.

R7 Default value for List fields

Analysis Low

GAP

Default values are supported for text, number, date, time, checkbox and some predefined fields, but not for List fields, which are among the most used in inspection forms.

RECOMMENDATION

Allow a default list value per form, overridable per project, and validate it when values are disabled.

R8 Form change history

Analysis Low

GAP

Ticket changes are logged in the Journal (TC-009, TC-011), but changes to the form itself (mandatory, defaults, permissions) have no visible history.

RECOMMENDATION

Record who changed which form setting and when, with the previous value, viewable from the form's more menu.

5 What works well

- ✔ Mandatory validation is enforced with an inline outline and a toast, and the dialog keeps entered data (TC-018, TC-019).
- ✔ Read-only fields explain themselves with the tooltip "Editing is disabled for this field due to your role permissions." (TC-012).
- ✔ Hidden fields are removed cleanly without breaking the layout of neighbouring fields (TC-013).
- ✔ Default values are pre-filled on load and stored with the ticket; changing a default does not alter existing tickets (TC-014 – TC-016, TC-030).
- ✔ A mandatory field hidden from a role does not block that role from saving (TC-028).
- ✔ A list value already used in tickets cannot be disabled (TC-023).
- ✔ List selections and field edits are traceable in the ticket Journal with the author's name (TC-009, TC-011).
